INSTALLATION INSTRUCTIONS
2” x 4-1/2” Offset Glazed for 1” Insulated Glass

Screw-spline joinery for #14 x 1” HWHSTS

Full height subsill flashing

Allows for direct attachment to substrate without blind seals.

Interior Glazed
These instructions are for typical installations. Reference shop drawings for special notations on installations and glazing.

Recommended guidelines for all installations:

1. **REVIEW CONTRACT DOCUMENTS.** Check shop drawings, installation instructions, architectural drawings and shipping lists to become thoroughly familiar with the project. The shop drawings take precedence and include specific details for the project. Field verified notations shown within shop drawings must be resolved prior to installation. The installation instructions are of general nature and cover most conditions.

2. **INSTALLATION.** All materials shall be installed plumb, level and true.

3. **BENCHMARKS.** All work should start from established benchmarks and column center lines established by the architect and general contractor.

4. **FIELD WELDING.** All field welding must be adequately shielded to avoid any splatter on glass or aluminum. Advise general contractor and other trades accordingly. All field welds of steel anchors must receive touch-up paint (zinc chromate) to avoid rust.

5. **SURROUNDING CONDITIONS.** Make certain that construction which will receive your materials is in accordance with the contract documents. If not, notify the general contractor in writing and resolve differences before proceeding with work.

6. **ISOLATION OF ALUMINUM.** Aluminum to be placed in direct contact with uncured masonry or incompatible materials should be isolated with a heavy coat of zinc chromate or bituminous paint.

7. **SEALANTS.** Sealants must be compatible with all materials with which they have contact, including other sealant surfaces. Consult with sealant manufacturer for recommendations relative to joint size, shelf life, compatibility, cleaning, priming, tooling, adhesion, etc. It is the responsibility of the Glazing Contractor to submit a statement from the sealant manufacturer indicating that glass and glazing materials have been tested for compatibility and adhesion with glazing sealants, and interpreting test results relative to material performance, including recommendations for primers and substrate preparation required to obtain adhesion. The chemical compatibility of all glazing materials and framing sealants with each other and with like materials used in glass fabrication must be established.

8. **FASTENING.** Only those fasteners used within the system are specified in these instructions. Due to the varying perimeter conditions and performance requirements perimeter fasteners are not specified in these instructions. Reference the shop drawings or anchor charts for perimeter fasteners.

9. **BUILDING CODES.** Due to the diversity in state, local and national codes that govern the design and application of architectural products, it is the responsibility of the architect, owner and installer to assure that products selected for use on each project comply with all the applicable building codes and laws. CORAL ARCHITECTURAL PRODUCTS exercises no control over the use or application of it’s products, glazing materials and operating hardware and assumes no responsibility thereof.

10. **EXPANSION JOINTS.** Expansion joints and perimeter seals shown in these instructions and shop drawings are shown at normal size. Expansion mullion gaps should be based on temperature at time of installation.
11. WATER HOSE TEST. After a representative amount of the storefront system has been glazed (500 square feet) and the sealant has cured, a water hose test should be conducted in accordance with AAMA 501.2 specifications to check the installation. This test should be repeated every 500 square feet during the glazing operation. Note: This test procedure should not be used for entrance doors.

12. COORDINATION WITH OTHER TRADES. Coordinate with the general contractor and sequence with other trades items which offset the storefront installation such as back-up walls, partitions, ceilings and mechanical ducts.

13. MATERIAL HANDLING:
   A. SHOP
      1. Cardboard wrapped or paper interleaved material must be kept dry.
      2. Immediately remove aluminum from cardboard wrapped or paper interleaved materials should it get wet to prevent staining or etching aluminum finish.
      3. Check arriving materials for quantity and keep record of where various materials are stored.

   B. JOB SITE
      1. Material at job site must be stored in a safe place well removed from possible damage by other trades.
      2. Cardboard wrapped or paper interleaved material must be keep dry. (See 13.A.2)
      3. Keep record of where various materials are stored.
      4. Protect materials after erection. Cement, plaster, mortar and other alkaline solutions are very harmful to the finish.

14. CARE AND MAINTENANCE. Final cleaning of exposed aluminum surfaces should be done in accordance with AAMA. 609.1 for anodized aluminum and 610.1 for painted aluminum.

15. CORAL ARCHITECTURAL PRODUCTS. It is the responsibility of CORAL ARCHITECTURAL PRODUCTS to supply a system to meet the architect’s specifications.
FRAME FABRICATION

Establish frame size and cut metal to length.

**STEP 1.**
Measure width of rough opening.
A. Measure opening at bottom.
B. Measure opening at center.
C. Measure opening at top.
   The frame width will be the smallest dimension less 1/2” allowing for a minimum 1/4” caulk joint at each jamb.

Repeat process to determine frame height.
A. Beginning on left side of opening, measure dimension from top to bottom.
B. Repeat at center.
C. Repeat at right side of opening.
   The frame height will be the smallest dimension less 13/16” allowing 5/16” for subsill and a 1/4” minimum caulk joint at the head and sill.

**STEP 2.**
Cut members to size.
A. Cut subsill to frame dimension plus 1/4”.
B. Wall jambs and intermediate vertical mullions are cut to frame height.
C. Horizontal members are cut to D.L.O.
D. Snap-on glass stops are cut D.L.O. minus (-) 1/16”.
FRAME FABRICATION

STEP 3.
Drill or punch holes in verticals for attaching horizontals.

Use Letter “F” (.257 Ø) drill.

FRAME FABRICATION

STEP 4.
Fabricate steel reinforcement where required.

Use with FS404T and FS405 Vertical Mullions

SR404

SR405

Custom Bar Stock

FS410T/FS411T

Drill 5/16" Ø hole as shown for attaching to FS404T with 1/4" - 20 x 1" bolt with nut and washer.

Attach steel reinforcement as shown.
FRAME FABRICATION

STEP 5.
Fabricate head and sill anchor holes. Reference anchor charts for number of anchor holes and locations for each substrate. First hole is always 2” from end.

Note: Anchor points required at quarter points (under setting blocks).
STEP 6.
Fabricate wall jamb for anchor holes when required.  (Reference anchor charts.)

FS407T

Clear hole for 1/4" Ø fastener

Note:
Do not locate anchor hole at intersection of intermediate horizontal. Locate hole just above or below horizontal. Check anchor chart for spacing and quantity.
FRAME FABRICATION

STEP 7.
Fabricate FL339T subsill flashing for 1/4” Ø countersunk non-structural fastener and weep slots. Hole location dimensions for fasteners in subsill are approximate. Drill 3/8” x 3/16” weep slots as shown in Detail “A”.

SUBSILL FLASHING

1/4” Ø countersunk holes for non-structural fastener

1. Drill / countersink 1/4” Ø holes for non-structural fasteners used for attaching subsill to substrate as shown.

2. Drill 3/8” x 3/16” weep slots in locations as shown. Locate one weep slot 6” from each end and additional slots approximately 48” on center. Total weep slots should average 2 each between each vertical mullion.
STEP 1.
Attach head, intermediate horizontal and sill to verticals using AS16 (#14x1” HHSTS) spline screws. (See Page 6 for hole prep locations).

CRITICAL SEAL:
Completely fill gasket reglet at bottom with sealant

Clean and apply sealant to each end of sill members before assembling.

Note:
Sill shown - Head similar
STEP 1.
Attach head, intermediate horizontal and sill to verticals using AS16 (#14x1” HHSTS) spline screws. (See Page 6 for hole prep locations).

Note:
*Install VG10 vinyl gasket into FS411T expansion mullion before installation.*
Add 1/8” of vinyl per foot of mullion, crimping top and bottom groove to hold vinyl in FS411T.

Clean and apply sealant to edges of all horizontal members before assembling.

Clean and apply sealant to each end of sill members before assembling.

**CRITICAL SEAL:**
Completely fill gasket reglet at bottom with sealant

**Note:**
Sill shown - Head similar
Apply SM5601 Tacky sealant tape to ED339-1 end dams and attach to each end of subsill with AS31 fasteners at spline locations as shown above.

Note: Must be used on all exterior installations.
FRAME INSTALLATION

STEP 1.
Center subsill into opening allowing for a 1/4" minimum shim space at each end to ensure a good caulk joint.

Shim beneath subsill to be a minimum of 1/4". Attach subsill flashing to structure with non-structural fasteners using attachment holes shown on Page 10. Cap seal fastener heads as shown.

Wedge shims tightly between end dams and jamb substrate on each end prior to installing frame panels. These shims prevent the end dam from dislodging while frame panels are being installed. Completely seal end dams as shown.

Run a continuous bead of DOW 795 sealant along the full length of the subsill “C” slot as shown above just prior to installing frame panels. Do not allow sealant to harden prior to installing frame panels. Remove excess sealant after panels are installed.

Note: Remove all debris from subsill to prevent clogging weep holes prior to installing panels.
STEP 2.
Screw spline joinery allows for frames to be shop fabricated into panels and shipped to job site assembled. Each panel must have at least one vertical deep pocket for glazing. Arrange panels so that two shallow pockets never face each other. *(Reference Page 12 of Frame Assembly.)*

Expansion mullions should be used in elevations exceeding 24'-0" in width to allow for thermal movement. *(See Page 23 for formula.)*

**NOTE:**
*Install VG10 vinyl gasket into FS411T expansion mullion prior to assembly.*
STEP 3.
After all panels are installed, shim beneath subsill at fastener location. Match drill holes through sill into substrate. Remove dust from hole and apply DOW 795 sealant as shown below into anchor holes prior to anchoring with structural fasteners. Cap seal fastener heads with DOW 795. Match drill holes through head into substrate, anchor and shim as shown. Install FS405 sill cover after sealing fastener heads.

Note: Do not penetrate upright leg of subsill flashing.

Once frames have been properly shimmed and anchored, apply continuous bead of sealant here.
**FRAME INSTALLATION**

**STEP 4.**
In high wind load areas, it may be necessary to attach jamb to substrate as shown. When required, match drill holes in jamb to substrate. Anchor and shim as required. Cap seal fastener heads with **DOW 795**.

When all frames are secured to the opening, then completely seal exterior and interior perimeter with a continuous bead of **DOW 795** sealant.
PREPARATION OF FRAME OPENING FOR GLASS

STEP 1.
Prepare the frame opening by removing all dirt and debris from the glazing pockets and gasket reglets.

STEP 2 - SETTING BLOCKS.
Glass should be set on two identical setting blocks having a Shore A Durometer of 85+ or -5. The preferred location is at the 1/4 points.

If the 1/4 point location causes excessive deflection of the intermediate horizontal, move the setting blocks equally towards the corners of the lite as far as the 1/8 points. The outer end of the block CANNOT be closer than 6” to the corner of the glass.

STEP 3 - DEFLECTION.
The intermediate horizontal must not exceed 1/8” and a door header is limited to 1/16”. Check dead load charts (Reference Page C1-3 of Architectural Manual) for proper setting block locations.
INSTALLATION OF TOP LOAD GLAZING GASKETS

STEP 1.
Cut gaskets a minimum of 3/16” longer per foot than aluminum extrusion.

STEP 2.
Do not stretch gasket to make them fit.
It is very important that gaskets are installed correctly as shown in Detail “A”, to prevent shrinkage at corners.

STEP 3.
Pull gaskets back 2” in both directions at corner intersections and seal with DOW 995 silicone. This should be done on interior and exterior for best performance.
**INTERIOR GLAZING**

**STEP 1.** Install exterior gaskets. Vertical gasket runs through. *Reference Page 19.*

**STEP 2.** Check dead load charts and shop drawings for correct setting block locations for intermediate horizontals. Position **SB12** setting blocks in horizontal and **SB3** in sill members. Rest glass on setting blocks and press glass against installed gaskets.

**STEP 3.** Center glass into opening following the four step procedure and press glass against installed gaskets. *See below.*

**STEP 4.** Install **FS403** glass stop as shown below.

**STEP 5.** Install **NG1** interior gaskets as shown on **Page 19.**

Glaze from bottom to top. Install **WD300-1** Water Diverter as shown before setting upper lite.

**WD300-1** Water Diverter is embedded in sealant at each end of horizontal.
STEP 2. Check dead load charts and shop drawings for correct setting block locations for intermediate horizontals. Position SB3 setting blocks in horizontal and sill members. Rest glass on setting blocks and press glass against installed gaskets.
STEP 3. Center glass into opening following the four step procedure and press glass against installed gaskets. See below.
STEP 4. Install NG1 interior gaskets as shown on Page 19.

Glaze from bottom to top. Install WD300-1 Water Diverter as shown before setting upper lite.

WD300-1 Water Diverter is embedded in sealant at each end of horizontal.
STEP 1. Locate splice sleeves near center of D.L.O. at panel positioned over splice.

A minimum 1/2" splice joint is required every 24 ft.

To avoid a three side adhesion, apply bond breaker tape to outside of sleeve before installation.

SS339 Aluminum break metal splice sleeve

Seal full length of splice

Apply bond breaker tape to subsill and splice sleeve full length of joint and seal over it.
SPECIAL CONDITIONS
EXPANSION MULLIONS

Calculated gap is determined by job conditions, project specifications, and temperature at the time of installation. Expansion mullions allow for 3/8” maximum movement.

EXPANSION GAP SIZE FORMULA = Length (“”) x $F^\circ$ difference x .000129

L = Length in inches, between center line of expansion mullion in elevation.

$F^\circ$ = Specified Temperature Variation

.000129 = Thermal Coefficient for Aluminum

EXAMPLE
Assume 100° temperature variation specified and temperature at job site on day of installation is 60°.

1. 100° - 60° = 40° temperature difference

2. Length of elevation between expansion mullions equals 20'-0" or 240"

3. $240" \times 40^\circ \times 0.000129 = 0.124"$. Therefore, set expansion mullion gap at 0.124" or 1/8".
